## Targeting and Propaganda in Autocratic Development Policy

Lorenzo Vicari (LSE)

- *work in progress* -

NSE Workshop  
September 16, 2024

# Introduction

## In a nutshell

This study was inspired by the economic analysis in Carillo 2021 and tries to illuminate *development under autocracy* analysing the **Battle for Wheat**, a flagship agricultural policy in fascist Italy.

It focuses on:

1. its long-term *legacy*,  
→ support for **neo-fascist** party MSI
2. the *mechanism* behind its persistence,  
→ responsibility attribution by **radio** propaganda
3. and the political *determinants* of the policy.  
→ **opposition** to the regime, **collective action** potential

And (in-exhaustive) literature review

- ▶ Does development **endanger or entrench** autocrats?
  - ▶ Development → democratisation demands (Treisman 2020): it can create a bourgeoisie (Lankina and Libman 2021), industrial labour (Rueschemeyer et al. 1992), and widen education (Chang and Wu 2022; Palma and Reis 2021).
  - ▶ Development → regime legitimacy: autocracies seek it (Geddes and Zaller 1989) to enhance compliance (Beetham 2013), increasingly through economic performance (S. Guriev and Treisman 2019; S. M. Guriev and Treisman 2022; Rozenas and Stukal 2019) seen as a "*key source of regime stability in non-democracies*" (Beazer and Reuter 2019).
- ▶ Do autocrats favour **loyal or opposing** communities?
  - ▶ Loyalists: ensure integrity of ruling coalition by distributing public goods (**buenodemesquitaLogicPoliticalSurvival2005**),
  - ▶ Opponents: counter subversive threats by "buying off" problematic segments of society (Bueno de Mesquita and Smith 2010).

# History

## The Battle for Wheat

Italy's reliance on imports:

- autarchy (Lyttelton 2004)
- agricultural modernization (Segre 1982)

The **Battle for Wheat** (BfW) began in 1925:

- ▶ introduction of enhanced varieties by Strampelli (Salvi, Porfiri, and Ceccarelli 2013)
- ▶ subsidies for machinery and fertilizers
- ▶ boosted *Travelling Chairs of Agriculture*

Impact on the diet is debated (Cohen 1979) but it increased wheat productivity (Carillo 2021).

## Radio and MSI

- ▶ (Rural) **radio**: rolled out starting in 1922. It was the main propaganda avenue (Monteleone 1976; Brendon 2000) + leveraged the BfW (Isola 1990; Galdi, Pietra, and Savini 2010): the best wheat farmers were "*the vanguards of the battle*" (Cannistraro 1975).
- ▶ **Movimento Sociale Italiano (MSI)**: founded in 1946 "*in opposition to the democratic system to maintain the idea of fascism alive*" (Ignazi 1998) to the point of being indicted in 1973 for reconstituting the PNF.

## Legacy - IV

The DiD is not entirely satisfying.

There is a good instrument for yield improvements (identified by Carillo 2021):

- ▶ theoretical change moving from low to intermediate level of input in **FAO's GAEZ v.3** potential yields.

Carillo 2021 constructs an indicator:

$$PRI = \frac{\text{intermediate-input wheat yields} - \text{low-input wheat yields}}{\text{low-input all crops yields}}$$

no change in other crops

## Strategic Allocation - Yields, argument

- ▶ When treatment is assigned based on *geo-morphological characteristics* (IV) the impact is *large*.
- ▶ When it is assigned endogenously, hence *politically* (OLS) the impact is *smaller*,
- ▶ because ex-ante opposed units are treated more!
- ▶ In fact, *controlling for political factors*, OLS and IV estimates look more *similar*.

The BfW looks like a political consolidation effort, in line with some historical accounts (e.g. Gagliardi 2012; Foot 2022).

## Strategic Allocation - Radio Reception

I also look at the improvement in radio signal by calculating  $\Delta \text{Signal Strength} = \bar{s}_{1925-1929} - s_{1925}$ .

	$\Delta$ Signal Strength			
Fascist vote %	-0.040** (0.012)	-0.040** (0.012)	-0.046** (0.012)	-0.046** (0.012)

# Next Steps

Some of the things to be thought more about

- ▶ *Targeting*, conceptually and empirically:
  - ▶ Is it targeting (supply-side) or just labor organisation (demand-side)?
  - ▶ How to disentangle them?
- ▶ *Legacy*, empirically:
  - ▶ Why is GAEZ a weak instrument without radio?
  - ▶ Robustness? → more appropriate handling of standard errors:
    - ▶ Heteroskedasticity → clustering in finite populations (Abadie et al. 2008): packages for standard errors with fixed effects
    - ▶ Spatial correlation (Gelfand 1998)
    - ▶ Autocorrelation (Hoxby and West 2007)
  - ▶ Radio reception? → regenerate radio with model for FM (Russo 2024)

# Conclusion

Tentative take-home message(s)

The case of the Battle for Wheat in fascist Italy suggests that in autocracies:

- ▶ and benefits are strategically allocated to *collective-action-threatening opposition*.
- ▶ development policy durably *entrenches* autocrats *when* its benefits are clearly attributed through *propaganda*,
- ▶ (Infrastructure-enabling propaganda is, likewise, *strategically allocated*.)

## PRI Composition

$$PRI_{low,i} = \sum_c \frac{\bar{p}_0^w \hat{q}_{c,(low)}^w}{\sum_j \bar{p}_0^j \hat{q}_{c,(low)}^j} P(c|c \in i) \quad (1)$$

$$PRI_{int,i} = \sum_c \frac{\bar{p}_0^w \hat{q}_{c,(int)}^w}{\sum_j \bar{p}_0^j \hat{q}_{c,(low)}^j} P(c|c \in i) \quad (2)$$

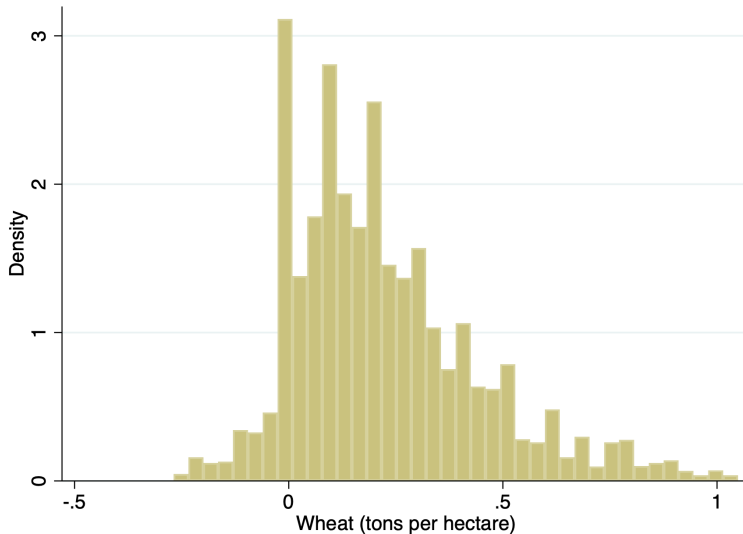

$$PRI_i = PRI_{int,i} - PRI_{low,i} \quad (3)$$

$i$  are municipalities,  $j$  crops, and  $c$  GAEZ cells, all at constant '19 prices ( $p$ ).
